Author's Note: The authors would like to acknowledge all the dedication and support of the *Arts Achieve* partners and all of their staff in this work: the New York City Department of Education Office of Arts and Special Projects, Studio in a School, ArtsConnection, the Dance Education Laboratory at the 92nd Street Y; the Weill Music Institute at Carnegie Hall, the Cooper Hewitt National Design Museum, and all the participating schools. This research was supported by two United States Department of Education grants: an Arts in Education Development and Dissemination grant and an Investing in Innovation grant. Opinions reflect those of the authors and do not necessarily reflect those of the granting agency.

Abstract

Arts Achieve: Impacting Student Success in the Arts was a five-year project (from 2010-2015), which involved a partnership between the New York City Department of Education (NYCDOE) and five of the city's premier arts organizations. *Arts Achieve* was guided by three over-arching goals: 1) to improve student achievement in the arts; 2) to enhance arts teacher practice; and 3) to integrate technology into arts classrooms.

In order to achieve these goals, Arts Achieve provided intensive and targeted professional development to arts teachers over a three-year period. Starting in 2011-2012, arts teachers formed art discipline-based professional learning communities (PLCs) to work together using a process of inquiry and action research that focused on reviewing student data and examining impact on current instructional practice. Additionally, each arts teacher was paired with a facilitator from the arts organizations to support them over the course of the project. The specific professional development activities included: on-site consultancies, assessment retreats, inter-visitations, and an online community. Participating arts teachers also were provided with resources to support this work, such as units of study and technology bundles.

Metis Associates, an independent research and evaluation firm, conducted a rigorous cluster randomized control trial study of *Arts Achieve* in order to examine its impact on arts teachers and their students, whereby 77 schools were assigned to treatment or status-quo control conditions by arts discipline (dance, music, theater, visual arts) and school level (elementary, middle, high). To measure students' arts achievement, in the planning year of the project, Benchmark Arts Assessments were developed in each arts discipline and school level. Findings with respect to the project's three main goals are presented from data collected during Years 1-3 of the evaluation.

Introduction

Teaching and learning in the arts, like any subject, requires the use of assessment to allow teachers to reflect on students' progress and adjust their instruction to meet students' needs. Assessment also provides students with feedback, which allows them to reflect on their own learning. More specifically, current research highlights the importance of balanced assessment (formative and summative) in instruction to support student learning and increase student achievement (Black & Wiliam, 1998; Hattie & Timperley, 2007; Kluger & DeNisi, 1996). In general, however, the arts lack access to high quality assessments to inform arts teachers about their students' knowledge and skills in a particular art form. The *Arts Achieve: Impacting Student Success in the Arts* project was conceptualized to address this issue and, in doing so, improve teacher instruction and student learning in the arts.

In spring 2010, the *Arts Achieve* project was funded by two United States Department of Education (USDOE) grants: the New York City Department of Education (NYCDOE) Office of Arts and Special Projects (OASP) received an Arts Education Model Development and Dissemination (AEMDD) grant and Studio in a School (STUDIO) received an Investing in Innovation (i3) grant to implement the program. The goal of *Arts Achieve* was to improve the quality of arts teachers' instruction through intensive and targeted professional development on the use of balanced assessment, leading to increases in students' arts achievement. To evaluate the efficacy of the *Arts Achieve* project, the project partners hired Metis Associates, a national evaluation and consulting firm, to conduct an experimental study. At the end of the first project year (2010-2011), which was used as a planning year, 77 NYC public schools were assigned to treatment or status-quo control conditions using a stratified (art discipline and school level)

random assignment process. In this article, we report final outcome data for the *Arts Achieve* project on arts teachers' instructional practices as well as on their students' arts achievement.

Theoretic Framework

The logic model, which is displayed in Figure 1, illustrates the theoretical framework of the *Arts Achieve* project. The project was based on the theory that when arts teachers participate in professional development, including being members of professional learning communities (PLCs), that focuses on action research and the use of balanced assessment strategies, the quality of their arts instruction will improve. In turn, the project hypothesizes that enhanced arts instruction will lead to improved student achievement in the arts. The paragraphs below provide an overview of research on these components, which guided the work of *Arts Achieve*.

Arts Achieve drew on current research around professional development for educators, which emphasizes the need for PLCs to develop the collective capacity of staff to work together in order to improve teacher practice and student learning. Through PLCs, teachers work together in teams, learning from each other in environments that are both school-based and job embedded (DuFour, Eaker, DuFour, 2005). The development of PLCs in the arts community is particularly needed, given that arts teachers can be the only staff members in their schools teaching in their content area, and many have reported that they do not feel integral to the faculty (Burnaford, 2009).

Several research studies provide robust support regarding the impact of PLCs on teacher practices, school culture, and student achievement. For example, Louis and Marks (1998) conducted a multi-site study in 24 schools on the impact of PLCs. Through classroom observations and interviews with teachers, they documented the presence of authentic pedagogy (i.e., pedagogy that emphasizes higher order thinking, the construction of meaning through

conversation, and the development of depth of knowledge that has value beyond the classroom) and examined the connection between the quality of classroom pedagogy and the existence of core characteristics of a PLC. This study found that the presence of a professional community in a school contributes to higher levels of social support for achievement and higher levels of authentic pedagogy. Bolam, McMahon, Stoll, Thomas, & Wallace (2005) examined survey data from 393 schools and interview-based case study data from 16 school sites. Both the survey and case study data revealed that when teachers work in PLCs, there are fundamental shifts in the ways that they approach their work, increasing their collaboration, reducing their feelings of isolation, and improving their overall morale.

There is also strong evidence that when teachers work in PLCs, their students experience increased achievement. Eight recent studies (Berry, Johnson, & Montgomery, 2005; Bolam et al., 2005; Hollins, McIntyre, DeBose, Hollins, & Towner, 2004; Louis & Marks, 1998; Phillips, 2003; Strahan, 2003; Supovitz, 2002; Supovitz & Christman, 2003) all found positive relationships between teachers' participation in PLCs and student academic achievement. In these studies, results of student achievement gains varied with the strength of the PLC in the school (Bolam et al., 2005; Louis & Marks, 1998) or with the specific focus of the efforts of teams or small communities of teachers (Supovitz, 2002; Supovitz & Christman, 2003).

Underlying all of the work of the PLCs is an emphasis on action research and use of appropriate balanced assessment strategies to review and discuss student work and teacher practice. Action research involves teachers engaging in inquiry and reflection on their current practice and student work. In contrast to one-day professional development sessions, professional development that involves action research is more participant-driven and incorporates inquiry and reflection that occurs over a period of time. Zeichner (2003) notes that

these components are in alignment with the standards and guiding principles for professional development as set by national organizations (e.g., the American Federation of Teachers, the National Councils of Teachers of English and Mathematics) and academic scholars (e.g., Darling-Hammond & McLaughlin, 1996).

Studies have found that teachers who engage in action research report that they have higher self-esteem and confidence levels (Dadds, 1995; Loucks-Horsely, Hewson, Love, & Stiles, 1998), develop self-analysis skills that are applied to their teaching (Day, 1984), and become more aware of how they impact their students (Allen, Shockley, & Baumann, 1995). In a review of studies on four action research professional development programs, Zeichner (2003) reported that engaging in action research helps teachers create a more student-centered environment, in which the teachers focus on listening to and observing their students to influence instruction. He explained further that teachers begin to see the point of view of their students and allow them to have more input in the classroom.

In order to inform teachers' action research, balanced assessment is a critical tool to gather evidence on student progress. Current research emphasizes the need for teachers to use assessment as a tool to help gather student performance data and assess how they should target their instruction to meet students' needs (Gewertz, 2010; Stiggins, 2010). Assessment also provides feedback to students in order for them to shape their understanding and improve their learning. Formative assessment helps students answer the question "How am I doing?" as they are learning new material and then summative assessment answers the question "How did I do?" at the end of learning a unit (Shute, 2008; Stiggins, 2005).

Recent meta-analyses have documented the effectiveness on the use of assessment practices on student achievement (Black & Wiliam, 1998; Hattie & Timperley, 2007; Kluger &

DeNisi, 1996). Black and Wiliam (1998) examined 250 studies from the research addressing a range of student factors and teacher instructional practices, including formative assessment strategies. They concluded that formative assessment has a more profound effect on learning than do other typical educational interventions, finding effect sizes between .4 and .7. Moreover, they concluded that assessment practices have a stronger effect on low achieving students than on high achieving ones, as they are instrumental in developing meta-cognitive skills and enhancing motivation. Hattie and Timperley's (2007) research described the results of 12 meta-analyses that included 196 studies and 6,972 effect sizes. Notably, they found that the average effect size for the use of formative feedback was .79.

Arts Achieve Project Implementation

Arts Achieve included a partnership between the NYCDOE OASP, five of the city's premier arts organizations, and Metis Associates, the project's evaluator. The arts organizations and their particular arts focus for the project were as follows: STUDIO (lead partner, visual arts); ArtsConnection (theater); the Dance Education Laboratory at the 92nd Street Y (dance); the Weill Music Institute at Carnegie Hall (music), and the Cooper Hewitt National Design Museum (technology). Figure 2 provides a description of each of the partner organizations. Prior to the first year of project implementation, the NYCDOE and the partner organizations developed and piloted 12 Benchmark Arts Assessments, one in each arts discipline (dance, music, theater, and visual arts) and school level (elementary, middle, and high). The Benchmark Arts Assessments measure students' arts content knowledge and performance skills based on local arts standards

set in the NYCDOE *Blueprints for Teaching and Learning in the Arts*.¹ The development of the Benchmark Arts Assessments is described further in the Methods section.

The *Arts Achieve* project provided professional development to arts teachers over a three-year period to help them engage in action research and to learn to use the data from the Benchmark Arts Assessments and ongoing formative assessments. Starting in the 2011-2012 school year, the arts teachers formed art discipline-based PLCs to work together toward the goal of improving their practice and student learning. Teaching artists from the arts organizations were partnered with the participating arts teachers to work together over the course of the project. In contrast to an artist-in-residence program, the teaching artist's role was that of a facilitator, who helped support the arts teacher with project work, as well as plan for instruction and provide assistance in the classroom. The *Arts Achieve* in-service professional development offered during the implementation years included:

- *On-site Consultancies*: Each facilitator visited his/her partner school about twice a month over the course of the school year, for a total of 22 visits over the course of the school year. During each of these visits, the facilitator and arts teacher worked directly with two of the teacher's targeted art classes² and participated in a separate joint instructional planning meeting. While the specific activities during each visit were unique to the needs of the arts teacher, the facilitator's time in the classroom

¹ The *Blueprints* set clear standards for what students should know, understand, and be able to do in each of the four arts disciplines (dance, music, theater, and visual arts) as they move through the school system from Pre-K through 12th grade. They are based on National arts standards and support the NYS Standards for Arts Instruction. Scope and sequence of learning are identified on the *Blueprints* through five strands: Art Making, Literacy in the Arts, Making Connections, Community and Cultural Resources, and Careers and Lifelong Learning. Benchmarks are delineated at four levels – Grades two, five, eight, and 12.

² In elementary schools, fifth-grade classes are targeted. In middle schools, eighth-grade classes are targeted, though some sixth- and seventh-grade classes may be included. In high school, the targeted classes can include any grade from nine through 12.

could include observing, modeling, or co-teaching. During the planning time, the arts teacher and facilitator often discussed the teacher's action research and frequently used the time to review student work, examine formative and summative assessment data, and discuss the instructional implications of data.

- *Assessment retreats:* The facilitators and arts teachers met three times over the course of the school year as a full group to focus on the appropriate use of formative and summative assessment strategies and the use of data from the Benchmark Arts Assessments to inform instruction. The assessment retreats were facilitated by Dr. Heidi Andrade, an expert in formative assessment practices. These meetings also provided an opportunity for participants to meet within their discipline and grade level specific PLCs.
- *Inter-visitations:* Two school inter-visitations per year provided additional opportunities for participants to meet within their PLCs. During these inter-visitations, the arts teachers deepened the work of the PLCs by discussing student work and sharing best practices around instruction and use of formative assessment strategies. The initial visit was to a model school, while all subsequent visits were to other treatment schools.
- *Online Community:* To support ongoing collaboration and share ideas and resources, a social-networking site was created for the project using Ning. This online community allowed the *Arts Achieve* participants to share student work by posting pictures or videos, to upload units of study or links to websites, to network with other teachers in the project, to make announcements, and to archive project documents.

In addition, the *Arts Achieve* project provided participating arts teachers with resources to support their work. Resources included *Blueprints*-aligned exemplary units of study, links to websites and other sources, their students' results from the Benchmark Arts Assessments, and technology bundles. The technology bundles included three iPads and a projector to use in their classrooms. The arts teachers participated in a full-day of training and ongoing on how to operate and incorporate the iPads into their instruction. Through the incorporation of these additional resources, teachers had increased access to arts content, formative and summative assessment strategies, and instructional strategies designed to reach students through multiple venues.

The *Arts Achieve* project provided the participating facilitators with additional training during each implementation year of the project. At least three full days of formal workshops were held over the course of each year. During these trainings, the facilitators were provided with techniques and strategies on how to work with their partner arts teachers, how to apply formative assessment in the classroom, and how to use student data from formative assessments and the Benchmark Arts Assessments to improve instructional practice.

Purpose of Study

The literature on the positive impact of formative assessment, action research, and PLCs on teacher instruction and student achievement, as described above, provides ample evidence to support the *Arts Achieve* framework. However, the literature is limited in that it does not provide evidence on impacts on arts teacher instruction or student achievement in the arts, specifically. The purpose of this study was to extend and deepen this previous research, and to examine whether, and to what extent, providing teachers with high quality and intensive professional development can positively impact arts teachers and their students.

Overall, the *Arts Achieve* study addressed the following three research questions:

1. What is the nature of *Arts Achieve* implementation? What are the successes and challenges of *Arts Achieve* implementation?
2. What is the impact of the *Arts Achieve* project on arts teachers' *Blueprints* knowledge and instructional practices, including their use of the *Blueprints* standards and their interpretation and use of formative and summative assessment data?
3. What is the impact of the *Arts Achieve* project on students' arts achievement? Are there differential impacts of the *Arts Achieve* project by arts discipline and school level?

Methods

To evaluate the impact of the *Arts Achieve* project, Metis Associates designed a cluster randomized control trial, whereby schools were assigned to either the treatment or status-quo control condition. This design allowed for comparisons between teachers and students who participated in the treatment with those who did not. This section describes how the sample was selected, the instruments used to collect teacher and student background characteristics and outcomes, and the analyses used to address the study's research questions.

Sample

The *Arts Achieve* sample was selected using a two-stage process. First, NYCDOE public schools that met the basic eligibility requirements were recruited and then randomly selected to participate. To identify eligible schools, information about their arts programs was gathered through the 2009-2010 NYCDOE *Annual Arts Education Survey*.³ To be eligible to participate, schools had to be part of the NYCDOE public school system and have an existing arts program in at least one arts discipline. Additionally, eligible *elementary* schools had to: 1) serve *all* grades 3-5; 2) offer at least 30 hours of instruction in one of the arts disciplines to all grades 3-5; and 3)

³ Each spring all, NYCDOE schools are asked to complete the *Annual Arts Education Survey*. The survey collects information on schools' arts programs. More specifically, the survey includes questions about student participation in arts courses by arts discipline, arts activities conducted, and certified school-based arts teachers.

have a certified or a cluster teacher assigned to teach the arts. Eligible *middle* schools had to: 1) serve *both* grades 7 and 8; 2) offer at least one full year of instruction in an arts discipline to eighth-grade students; and 3) have an arts teacher on staff certified to teach the arts. Eligible *high* schools had to: 1) serve *any* grade 9-12; 2) offer at least one full year of instruction in an arts discipline to students in any grade 9-12; and 3) have an arts teacher on staff certified to teach the arts.

Two informational meetings in winter 2011 were held to describe the program and to recruit volunteer schools to participate in the study. Schools recruited for participation were blocked on two characteristics – arts discipline (dance, music, theater, and visual arts) and school level (elementary, middle, and high schools), thereby creating 12 blocks. In cases where there were more eligible schools than needed, schools were randomly selected to participate.

In the second stage of the selection process, schools were randomly assigned to the treatment or control group. In the first year, within each arts discipline block, eight schools were selected at the elementary level, six at the middle school level, and six at the high school level. At the elementary school level, five schools were assigned to the treatment group and three schools were assigned to the control group. At the middle and high school level, three schools were assigned to the treatment group and the three schools were assigned to the control group. In each implementation year, some schools dropped from the program, and in Years 2 and 3, schools were added. As schools were added, an even number of schools were selected for participation. Half of the schools were then randomly assigned to the treatment and half to the control group, according to the appropriate discipline and school level block. Tables 1-3 display the number of participating schools in the treatment and control groups at each discipline and school level block, including those that dropped out in each Year 1-3 and were added in Years 2

and 3. In Year 1, a total of 77 schools, 43 treatment and 34 control, participated in the full first year of implementation. In Year 2, a total of 83 schools (47 treatment and 36 control) completed participation; and in Year 3, a total of 78 schools (44 treatment and 34 control) completed participation. A total of 100 unique schools were included in the study. In total, 64 schools (37 treatment and 27 control) participated across all three years, and 36 (16 treatment and 20 control) participated for two or fewer years.

The treatment was mainly targeted towards the school's arts teacher in the arts discipline upon which the school was blocked. Within the treatment schools, the arts teachers' targeted classes in the treatment and control schools were selected based on grade (grade 5 in elementary, grade 8 in middle school,⁴ and grades 9-12 in high school); year-long instruction (all target classes had to participate in year-long arts instruction); and (if multiple classes met these eligible requirements) scheduling convenience. The classes selected for assessment in the control schools were selected using the same criteria. Arts teachers and in the treatment schools participated in all the *Arts Achieve* professional development, whereas the arts teachers in the control schools only participated in evaluation activities.

In general, one arts teacher per school participated in the treatment, although there are some schools with more than one participating arts teacher. A total of 121 arts teachers participated in the project, including 65 arts teachers from the treatment schools and 56 arts teachers from the control schools. Thirty-one of the treatment arts teachers (48%) and 20 of the control teachers (36%) participated in the program for all three years.

More than 4,000 students participated in the program during each year of implementation. This included 4,066 students in Year 1 (2,046 treatment and 2,020 control),

⁴ In some cases, if eight grade could not be targeted the treatment was geared toward grade six or seven.

5,402 students in Year 2 (2,638 treatment and 2,764 control), and 5,668 in Year 3 (2,812 treatment and 2,856 control). Tables 4-6 display the demographic profiles of participating students by group.

Thirty-three teaching artists, who all had previous experience working in schools, participated in the project as facilitators (nine dance, five music, nine theater, and ten visual arts). The majority of facilitators were partnered with only one arts teacher; however, some worked with two or three teachers.

Instruments

Ongoing data collection for *Arts Achieve* consisted of program documentation, surveys and focus groups with arts teachers, and the Benchmark Arts Assessments. Additionally, secondary data were collected from the NYCDOE; including students' background characteristics, and English Language arts achievement. This section describes the *Arts Achieve* data collection procedures and instruments.

Program documentation. To measure *Arts Achieve* implementation, program documentation is collected, including professional development materials, participant attendance, and observations of the trainings. Data on the number of on-site consultancies were also collected.

Arts teacher surveys. To collect information on arts teachers' knowledge and instructional skills, Metis and program staff developed surveys and administered them to the participating arts teachers in the treatment and control schools at the beginning (pre) and end (post) of the school year. The surveys asked questions about arts teachers' characteristics, including their years of teaching experience and certification in the designated arts discipline. The surveys also used Likert-scale questions to ask about arts teachers' knowledge and use of the

NYCDOE *Blueprints*, and use of formative and summative assessment data. Open-ended questions were also included to learn about the successes and challenges of implementing the *Arts Achieve* work in the school. A total of 42 arts teachers (35%) responded to both the baseline and post (spring 2014) surveys, including 30 treatment teachers (46%) and 12 control teachers (21%).

Composite scores of teachers' *Blueprints* knowledge, *Blueprints* use, and formative assessment strategies were calculated using multiple items on the arts teacher pre- and post-surveys. The *Blueprints* knowledge scale consisted of five items and had a Cronbach's alpha value of 0.77 on the post-survey. The use of *Blueprints* as well as the use of formative assessment strategies post-survey scales were both found to have high internal consistencies (4 items $\alpha=0.79$, 3 items $\alpha=0.73$, respectively).

Benchmark Arts Assessments. As described above, the Benchmark Arts Assessments were developed in the planning year and were used to measure the impact of *Arts Achieve* on students' arts achievement. Prior to the first year of implementation, teams were assembled to spearhead the creation of the assessments. The teams were led by the NYCDOE Arts Directors in the four arts forms, and also were comprised of school-based arts teachers, staff from the participating arts organizations, and NYCDOE experts in test and measurement. A total of 12 assessments were developed (three [one each for 5th grade, middle school, and high school] in each of the four arts disciplines [dance, music, theater, and visual arts]). The assessments were designed to measure the extent to which students have developed the knowledge and skills that are expected in a particular art form by fifth grade, middle school, and high school, according to the NYCDOE *Blueprints*. They also have been aligned with the Common Core Capacities in English Language Arts.

The Benchmark Arts Assessments each have multiple components, including performance and written sections, and include activities that address content knowledge, transferable concepts, and skills in the designated arts discipline. The assessments allow students to demonstrate their depth of knowledge in the content area through the analysis of performances, evaluation of other masterworks, and the creation of their own works of art. Question types include short-answer, fill-in-the-blank, multiple choice, and performance tasks. The majority of the questions were scored using a four-point scaled rubric.

Prior to each administration of the assessments, *Arts Achieve* staff provided training for adjudicators in administering and scoring the assessments. The adjudicators were current or retired NYCDOE arts teachers or facilitators. Separate trainings were conducted for each of the arts disciplines, but each included background on the context and purpose of the Benchmark Arts Assessments and training on the rubrics to score student work. Two adjudicators each administered and scored the assessments.

In spring 2011, the assessments were piloted in a sample of NYCDOE public schools that met the same requirements as the study schools, and the psychometric properties of the assessments were analyzed. Based on the results of the pilot, the assessments were found to have acceptable levels of reliability and validity. The assessments are administered to students in participating classes in the treatment and control schools in both the beginning (pre) and end (post) of the school year. Total scores for each of the assessments use a scale of 0 to 100.

Slight variations were made to the assessments in each of the implementation years. Tables 7-12 display the internal consistencies of each of the fall and spring Benchmark Arts Assessments. The Cronbach's alpha values all fall within the acceptable range, at .70 or above, with the exception of the middle school theater *musical theater design* task, which was .67.

Inter-rater reliabilities were calculated for each task scored using a rubric on each of the assessments. Across all three years of post-test items, 78% of the items fell at .31 or above and 23% fell at .70 or above. See Tables 13-16 for a summary of the interrater reliability data.

Secondary data. Data on treatment and control students' characteristics were obtained from the NYCDOE to use as covariates in the analysis models. Student characteristics include student demographics (including gender, race/ethnicity, English language learner status, special education status, and free/reduced priced lunch status), and average daily attendance. Students' scores on the New York State English Language Arts (NYS ELA) exam also were collected as a measure of student academic achievement. In elementary school and middle school, the NYS ELA assessment is administered to all students in grades three through eight in the spring of each school year.

Data Analysis

Descriptive statistics were calculated, including frequencies, means, and standard deviations, on the attendance, survey, and arts achievement data. Three-level hierarchical linear modeling (HLM) was conducted to measure the impact of the *Arts Achieve* project on students' arts achievement as well as on teachers' instructional practice. Additionally, multiple regression analyses were conducted to measure the impact of the *Arts Achieve* project on arts teachers' use of technology. Potential confounding factors that have a relationship with the outcomes (e.g., student characteristics, ELA achievement) were included in both the HLM as well as the multiple regression analyses to reduce threats to the study's internal validity. Covariates included in the teacher outcome models included arts teachers' years of experience, arts discipline certification, and pre-survey composite scores. In the student arts achievement models, student demographics (i.e., gender, race, English language learner status, special education status, free

and reduced price lunch status, and average daily attendance) and prior achievement (i.e., spring 2011 NYS ELA exam score and pre-Benchmark Arts Assessment score) were used as covariates. All covariates included in the HLM multiple regression models were grand mean centered, except for the treatment indicator. For statistically significant impact effects, Glass's delta was calculated to obtain the impact's effect size.

Results

As stated above, the *Arts Achieve* project was based on the theory that participation in the *Arts Achieve* professional development would have positive impacts on arts teachers' knowledge and instructional skills and, in turn, on students' arts achievement. This section presents implementation and impact findings of the project following all three years of implementation,

Implementation Findings

As shown in the Arts Achieve logic model, activities included professional development for arts teachers intended to impact on their instruction in the classroom with students, as well as some school-wide activities, such as school arts teams meetings. For purpose of examining the fidelity of implementation (FOI) with which Arts Achieve was implemented, four components of implementation were defined. Component 1 consisted of attendance at the professional development workshops, including the facilitator trainings, annual kick-off meetings, assessment and instructional retreats, and inter-visitations. Component 2 of the program consisted of the completion of on-site consultancies. Component 3 was comprised of the classroom planning and instruction activities that occurred during the on-site consultancies, including the use of formative assessment and technology strategies in the classroom. Finally, Component 4 was comprised of school planning and programming activities, including facilitator, art teacher, and

school administrator attendance at the school arts team meetings and the proportion of participating students who received year-long instruction. The evaluation team worked with the project staff to define fidelity thresholds for each component at the participant or school level, as well as at the program level.

Component 1 was calculated based on eight indicators and ranged from 0 to 100 points. A fidelity threshold at the participant level was set at 78 points or more. Component 2 was calculated based on one indicator, which ranged from 0 to 100 points, and the fidelity threshold was a score of 80 or more. Component 3 was calculated based on nine indicators and ranged from 0 to 160 points, with a fidelity threshold of 138 points or more. Lastly, Component 4 was calculated based on four indicators, ranging from 0 to 40 points, with a threshold of 31 points or more. At least 75 percent of schools had to meet the fidelity threshold for each component in order for the program to meet fidelity.

Table 17 displays the program level fidelity results from all three years of implementation. In each year of implementation, the program implemented the on-site consultancies with fidelity. Although the majority of participating *Arts Achieve* treatment schools implemented the on-site consultancies with fidelity, there was some slight variation from year to year. In Year 1, 91 percent of the treatment schools implemented the on-site consultancies with fidelity, as compared to 89 percent in Year 2, and 96 percent in Year 3. In all three years, however, the program did not meet the fidelity thresholds for any of the other three components, including professional development, classroom planning and instruction, and school planning and arts programming. For the professional development component, 42 percent of treatment schools met the participant-level fidelity in Year 1, 28 percent in Year 2, and 34 percent in Year 3. About half (47%) of treatment schools implemented the classroom planning and instruction

component with fidelity in Year 1, 57 percent in Year 2, and 48 percent in Year 3. For the school planning and arts programming, 49 percent of treatment schools met fidelity in Year 1, as compared to 23 percent in Year 2, and 18 percent in Year 3.

The on-site consultancies were the component over which the project had most direct control. Therefore, it is perhaps not surprising that the level of fidelity was highest for this component. Moreover, the *Arts Achieve* implementation of the professional development, classroom planning and instruction, and school planning and arts programming components confronted challenges that are not atypical to programs implemented in high-need, urban schools. The participating art teachers and administrators experienced numerous demands on their time, and oftentimes, art can take a backseat to content areas that are subject to high-stakes testing. As a result, art teachers and administrators often found it difficult to leave the building for professional development workshops. Administrators also found it difficult to hold at least three school arts team meetings throughout the school year.

In terms of classroom planning and instruction, the art teachers often found it challenging to focus on planning when the facilitator was at the school site, due to other on-site demands placed on the arts teachers. Furthermore, while most of the facilitator and teacher partnerships were strong, a few suffered from trust issues, teacher reluctance to change their practice, and/or personality conflicts all of which could have affected implementation. Lastly, in Year 3, the final year of implementation, a fair amount of attention was paid toward documenting the *Arts Achieve* work for dissemination efforts. According to several of the arts teachers and facilitators, they felt it took away from the primary focus of implementation, which may explain the low fidelity scores in Year 3.

Despite challenges in achieving fidelity of implementation for the project, many participants were highly positive about the impact of the program. For example, arts teachers were very enthusiastic about having the opportunity to collaborate with other arts teachers working in the same discipline and grade level. As one arts teacher noted, “The best part of this grant is meeting with other art teachers to share ideas, concerns, thoughts, and triumphs.” Other arts teachers reported that the project increased the rigor of their work, making their work with students better aligned with arts standards. As one teacher put it, “My principal goal this year was to create an arts program which focuses on rigorous curriculum and authentic assessments. Arts Achieve has opened the door for this work. I have a clearer understanding of what is needed to implement arts programs that are aligned to high student content and academic achievement standards.” Along these lines, another arts teacher indicated, “The Arts Achieve project has greatly improved my assessment practices. I now use clearer rubrics, and I introduce them significantly earlier in the learning process.” Most importantly, however, many of the teachers reported that they saw the impact that the project had on their students. As one dance teacher noted, “[Students] have come to expect that their work will be "recorded." It makes them feel empowered and that the work they are doing is important. They have progressed from looking at themselves only as individual dancers/choreographers to looking at themselves as part of an ensemble.”

Impact Findings

Improving student achievement in the arts. In each year of implementation, students in the treatment schools made greater gains in their arts achievement than participating students in the control schools. The results of HLM analyses indicated that participating students in the treatment schools made significantly greater gains in their arts achievement than participating students in the control schools, after controlling for student, teacher, and school background

characteristics in Years 1, 2, and 3 of implementation. The gains between the students in the treatment and control schools were not statistically significant in the third year of implementation. The effect Year 1 effect size was 0.28, the Year 2 effect size was 0.20, and the Year 3 effect size was 0.09. See Table 18 for these results.

To determine if there were differences in the impact of *Arts Achieve* by arts discipline, separate HLM analyses were conducted for the appropriate subsample the each implementation year. At the end of the first year of implementation, after controlling for student, teacher, and school characteristics, the results indicate that students in the music and theater treatment schools scored higher on the Benchmark Arts Assessments than participating students in the music and theater control schools. The Year 1 music effect size was 0.28 and the Year 1 theater effect size 0.43. Similar results were evident in music in the second implementation year. After controlling for student, teacher, and school characteristics, there was a statistically significant effect of *Arts Achieve* in the music treatment schools, with an effect size of 0.47. In the third year of implementation, the gains between the students in the treatment and control schools were not statistically significant by discipline. See Table 19 for these results.

Enhancing arts teacher practice. *Arts Achieve* aimed to improve arts teacher practice by increasing their use of formative assessment strategies to identify gaps in students' knowledge and skills, aligning their content with the *Blueprints*, and improving their use of technology for instruction and assessment. To measure whether change occurred in teacher practice, arts teachers completed annual pre/post surveys, through which they self-reported the frequency with which they used formative assessment strategies (i.e., teacher descriptive feedback, peer feedback, student self-reflection, and student self-assessment), taught the strands of the *Blueprints* (e.g., developing arts-based literacy, making connections through the art form), and

used technology (e.g., iPads, Smart board) in instruction. Rating scales ranged from 1 (lowest use) to 6 (highest use). An average across items was calculated to create a composite measuring arts teachers' instructional practice.

Multiple regression analyses of the instructional practice data indicate that there was a statistically significant effect of *Arts Achieve* on arts teachers' instructional practice in both Years 1 and 2 of implementation. In Year 3 of implementation, although the arts teachers in the treatment schools made greater gains than the arts teachers in the control schools, these gains were not statistically significant. The analyses controlled for teacher background characteristics and also adjusted for lack of baseline equivalence between the treatment and control group. The effect Year 1 effect size was 0.53, the Year 2 effect size was 0.59, and the Year 3 effect size was 0.27. See Table 20 and Figure 3 for these results.

Data from interviews with arts teachers provided evidence to support the positive gains shown in the analyses. One teacher explained that the project allowed her to perfect her craft as a teacher. Another teacher explained that through his review of the data, he knows where his students' weaknesses are, and they are aligned with the instructional areas in which he did not place focus on over the course of the year. Yet another teacher summarized that because of *Arts Achieve* she now has a better understanding of formative assessment, which has allowed her to teach in such a way that her students have become more responsible for their own learning. Overall, teachers were most positive about the PLCs that they participated in through the project, as well as having the facilitators, who served as "critical friends" in their classrooms. They explained that the project addressed the commonly felt isolation that arts teachers feel and often catapulted them to being leaders in their buildings, as the work was aligned with the most current

educational discussions about performance assessment, using data to inform instruction, formative strategies, and assessing the Common Core.

A set of post-implementation observations of participating arts teachers was conducted in the fifth and final year of the project. Data from these observations indicated that many of the arts teachers were continuing to use formative assessment and technology practices that they learned through the grant. While most teachers were not able to maintain their connections with their PLC groups, several had spread the practices they learned to all classes they teach and were able to turnkey learnings to other teachers at their schools. Many also were involved in other arts initiatives and were continuing to improve their knowledge and practice.

Integrating technology into arts classrooms. *Arts Achieve* teachers received technology bundles to use in their arts classrooms. Teachers were expected to use the iPads in various ways, including: taking pictures of student work; taking video to record students' performances and reflections; and using applications for instruction. The use of technology over the course of the three years of implementation was tracked using the implementation logs, which the facilitator and arts teacher pairs completed together during each school visit. The pair indicated if technology (i.e., iPad, desktop/laptop, Smart Board, video camera, still camera, sound system, projector or other device) was used in a given lesson.

According to data gathered through the logs, technology was used during 60 percent of the lessons in the first year of implementation. The percentage of use increased to 74 percent of lessons in the second year and 76 percent in the third year. Data were also analyzed for use of the iPads specifically, which were distributed to the *Arts Achieve* teachers in the winter of the first implementation year. By the end of that year, iPads were used for instruction during 24 percent of lessons, with percentages increasing to 46 percent the second year and 57 percent in the third.

Discussion

Arts Achieve was an extremely ambitious project that served an important unmet need in arts education. The project was designed not only to enable the NYC DOE to take the next step following their development of the *Blueprints* standards—to assess whether students are meeting these standards—but also to provide professional development and intensive supports to arts teachers so they might identify the gaps in student learning and have the instructional tools to fill them. The project was highly successful in many ways, including the development of high-quality, valid and reliable Benchmark Arts Assessments that may be used by arts teachers throughout NYC and beyond; and exemplar formative assessment practices, unit and lesson plans, and professional development models. Furthermore, data from the rigorous experimental design also indicate that the project had significant impact on the instructional practices of participating teachers and the arts achievement of their students. While the first two years of *Arts Achieve* show extremely strong results, the data indicate that the effect in Year 3 was not as strong. There are many possible explanations for the lack of significant findings in the final year of implementation. For example, it may be due to the greater amount of time that teachers and facilitators spent on documenting the *Arts Achieve* work in the final year as compared to the first two years. Though these efforts were extremely useful for replication efforts, several arts teachers and facilitators reported that it took away from implementation efforts. Additionally, it may be that the lack of findings regarding teachers' instructional practice is due to low response rates. Survey data collection from the participating treatment and control teachers was often challenging, becoming more so over time.

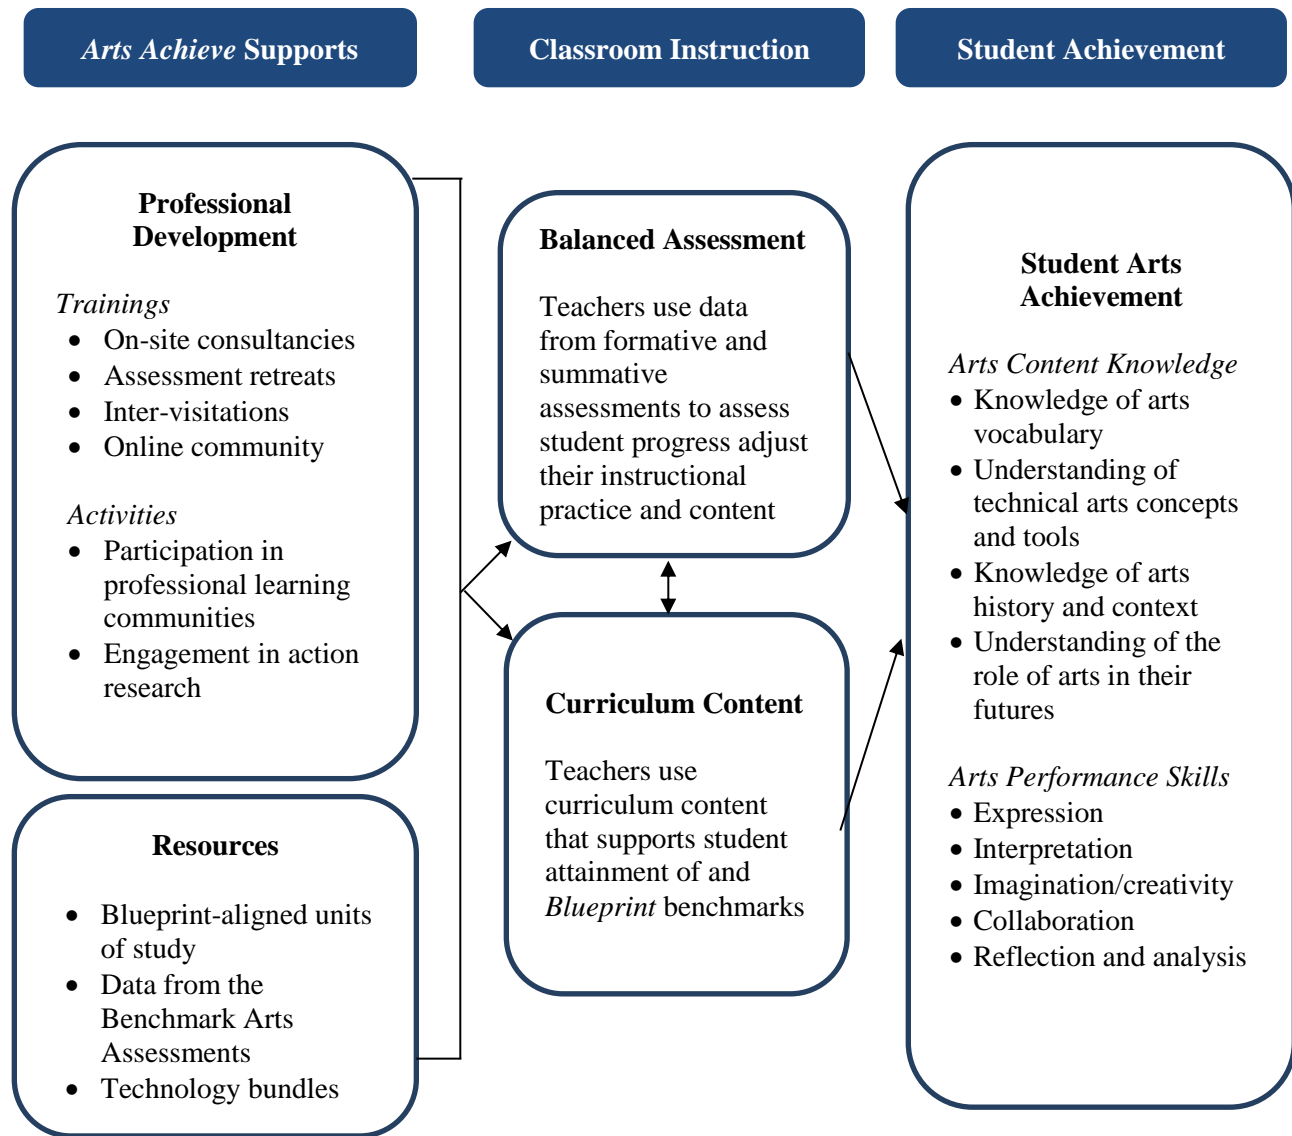

Figure 1. Arts Achieve Logic Model.

 <p>The New York City Department of Education (NYCDOE) consists of over 1,700 schools that serve 1.1 million students each year. The NYCDOE Office of Arts and Special Projects (OASP) supports universal access to arts education and increased quality in the arts through supports for school leaders, the development of curriculum and professional development for teachers of dance, music, theater, visual art, and the moving image.</p>	
 <p>Founded in 1979, ArtsConnection provides in-school and after school programs taught by professional teaching artists in dance, music, theater, and visual arts in NYC schools.</p>	 <p>For twenty years, the 92Y Dance Education Laboratory has provided a professional development program to dance educators nationwide interested in developing their teaching practice.</p>
 <p><i>Lead Partner</i></p> <p>For 36 years our community of professional artists has been teaching visual arts to hundreds of thousands of New York City children in under-served public schools, daycare centers, and community-based organizations. We offer quality art workshops where children explore their creativity and learn the joys and benefits of making art. Studio also collaborates with and develops the ability of those who provide or support arts programming and creative development for youth both in and outside of schools.</p>	 <p>The Weill Music Institute</p> <p>The Weill Music Institute creates visionary programs that embody Carnegie Hall's commitment to music education. These programs inspire audiences of all ages and nurture tomorrow's musical talent, reaching more than 400,000 people each year through national and international partnerships, in New York City schools and community settings, and at Carnegie Hall.</p>
 <p>Smithsonian Cooper-Hewitt, National Design Museum</p> <p>Smithsonian's Cooper-Hewitt, National Design Museum is the only museum in the nation devoted exclusively to historic and contemporary design. The Museum presents compelling perspectives on the impact of design on daily life through active educational and curatorial programming.</p>	 <p>Metis Associates is a national research and consulting firm headquartered in New York City. Metis has over 35 years of experience in education-based evaluation, working with a wide range of organizations committed to making a meaningful difference in the lives of children, families, and communities.</p>
